

In the Specification:

Please replace the following amended paragraphs:

**Page 8, paragraph 1, lines 1 to 7 insert the following paragraph:**

In Figure 5 is shown an arrangement which uses the opening of a break open window on a laminated ticket product to provide the switch action for the sound and/or lights. The break open window is of a conventional type as shown where it is connected to the ticket along one side to form a hinge line and can be torn away along three sides to allow the window to be opened while remaining attached to the ticket. The switch arrangement when using a break open window can be provided by a coating on the rear surface of the window which connects to printed conductive traces printed onto the rear surface of the ticket so that when the window is opened the connection provided by the conductive rear side of the window is removed thus activating the switch as previously described.
